1 : INTRODUCTION

• Project Overview

Wind power generation differs from conventional thermal generation due to the stochastic nature of wind. Thus wind power forecasting plays a key role in dealing with the challenges of balancing supply and demand in any electricity system, given the uncertainty associated with the wind farm power output. Accurate wind power forecasting reduces the need for additional balancing energy and reserve power to integrate wind power. For a wind farm that converts wind energy into electricity power, a real-time prediction system of the output power is significant. In this guided project , a prediction system is developed with a method of combining statistical models and physical models. In this system, the inlet condition of the wind farm is forecasted by the auto regressive model.

• Purpose

Due to the unpredictable nature of Wind speed and direction (weather condition). Because of this the power generated by a wind mill is irregular and unpredictable. The power generated depends on a large number of variables like, season, temperature, yearly currents, humidity, pressure, location, altitude, height off the turbine, blade size, blade pitch and many more. Owing to the irregular nature of the output power it is very difficult to integrate this source of renewable energy with the grid. In consequence Wind Farms loss revenue unable to supply the power at the right time to the grid.

2 : LITERATURE SURVEY

• Existing Problem

Here, we will take a look at all the previous solutions, attempts and implementations to Predict the energy output of wind turbine based on weather condition.

1. There are many renewable energy sources that can be used to obtain electrical energy from natural sources in the world. Especially, wind energy plays an increasing role thanks to its feasibility and efficiency. Due to the source of wind energy, efficiency of wind farm is highly depending on the weather conditions. The main issue to obtain maximum performance is to predict the output. This situation provides collaborative production of different energy sources more efficiently with avoiding over-cost and overproduction.

2. Monitoring and predicting wind power output more precisely can be very beneficial for an increasingly competitive Wind Power industry. Although many advances have been made throughout the last decades, the production forecast is still based mainly on the manufacturing power curve and wind speed. Even

though this approach is very useful, especially during the design phase, it does not consider other factors that affect production, such as topography, weather conditions, and wind features. A more precise prediction model that is able to recognize production fluctuation and is tailored using current operational data is proposed in this paper. The model analyzes the performance through Meteorological Mast Data (Met Mast Data) and then uses it as an input to monitor and predict power output. As a result, the model proposed achieves high accuracy and can be key to understanding the wind turbine asset's behavior throughout its lifespan, assisting operators in decision making to increase overall power production.

3. Extracting electricity from renewable resources has been widely investigated in the past decades to decrease the worldwide crisis in the electrical energy and environmental pollution. For a wind farm which converts the wind power to electrical energy, a big challenge is to predict the wind power precisely in spite of the instabilities. The climatic conditions present in the site decides the power output of a wind farm. As the schedule of wind power availability is not known in advance, this causes problems for wind farm operators in terms of system and energy planning. A precise forecast is required to overcome the difficulties initiated by the fluctuating weather conditions. If the output is forecasted accurately, energy providers can keep away from costly overproduction. In this paper, an end-to-end web application has been developed to predict and forecast the wind turbine's power generation based on the weather conditions. The prediction model has been developed using Bidirectional Long Short-Term Memory which is a unique kind of RNN (Recurrent Neural Network)

Problem Statement Definition

Predict the output power of a Wind Turbine at any given time provided with Weather Conditions. Using Machine Learning that takes on previous performance data and real time weather parameters to predict the energy output will help in integrating with the grid and make use of its full potential. Accurate wind power forecasting reduces the need for additional balancing energy and reserve power to integrate wind power. To make use wind energy efficiently the accurate power output is required. When power output of a wind mill at a given time is known we can integrate it with grid and make use of this renewable source of energy rather than conventional non-renewable sources.

3 : IDEATION AND PROPOSED SOLUTION

• : Empathy Map Canvas

• : Ideation And Brainstorming

1

Define your problem statement
What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.
 5 minutes

PROBLEM

How might we able to use the power generated by Wind Turbines efficiently ?

Brainstorm
Write down any ideas that come to mind that address your problem statement.
 10 minutes

TIP
You can select a sticky note and hit the pencil icon (switch to sketch) icon to start drawing!

Yuvasree	Vidhyasri	Silambarasi	Ramya
Turning the turbine direction	Increasing the blade surface area	Build the Wind Mill taller	Build the Wind Mills near to Big Cities
Analyze the climatic conditions	Determine the power output based on previous years	Predict depending on the season	Construct the Wind Mill at a higher altitude
Configure the grid based on prediction	Communication between Wind Mills in a farm	Build a model with Weather Forecasts	Consider the physical parameters
Predicting wind Direction	Build the turbine in a windy region	Make use of the Monsoon currents	Reduce the blade weight

3

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

🕒 20 minutes

Changes in the Hardware of the Wind Mill proves expensive and takes longer for R&D

Configuring the entire grid is challenging as nation wide it has to be implemented

Use past history along with Real time weather condition to predict Power output

Building a taller and bigger Wind Mill will not serve for its increased cost and complexity

Using only Weather Conditions for determining Power output is inaccurate

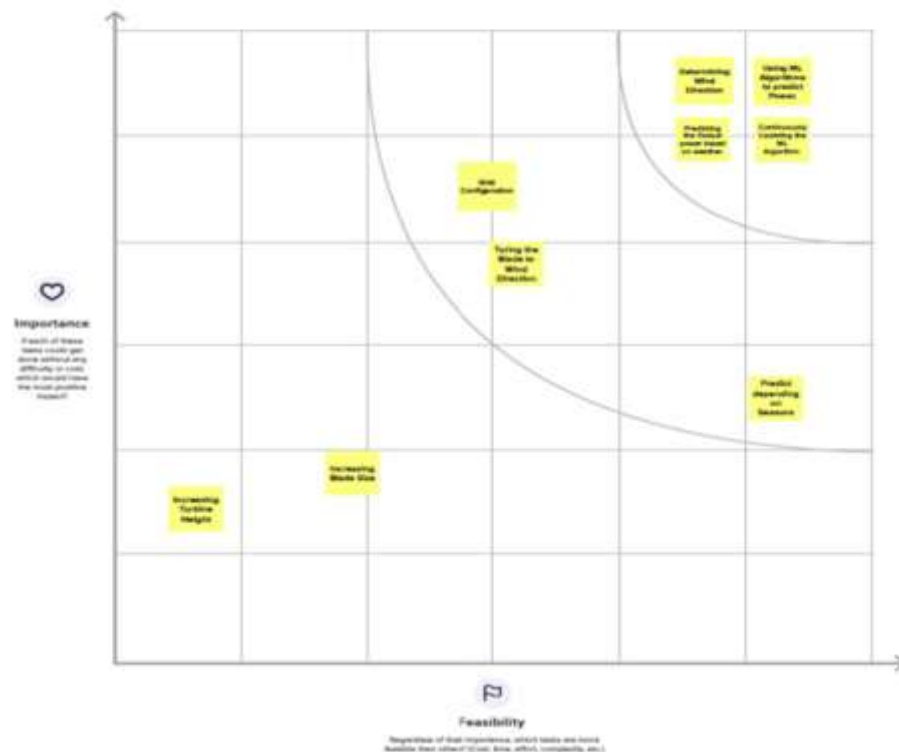

Continuously update the algorithm with the actual and predicted value

4

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

🕒 20 minutes

• : Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	It is necessary to find a way to predict the energy output of a wind turbine in different weather conditions. The obtained wind energy must be used to give a steady supply of electricity.
2.	Idea / Solution description	It is necessary to analyse and to store the data of the wind turbine in different weather conditions. With the past data stored in the database, we can predict the output of a wind turbine. And a prediction system is developed with a method of combining statistical models and physical models. Hence the output energy can be forecasted by the auto regressive model.
3.	Novelty / Uniqueness	Present wind farms don't have any methods to predict the output energy based on the changing weather conditions. By implementing this model, it can be useful to predict the output energy before and the efficiency of the wind farms can also be improved.
4.	Social Impact / Customer Satisfaction	Currently wind energy is not the primary source of electricity, but by implementing our solution we can produce more energy. So the utilisation of non renewable resources can also be minimised. A wind farm with prediction mode would be more efficient than the present one. Switching to a clean source of energy is good for both human health and the environment.
5.	Business Model (Revenue Model)	Improvement of life standard, local employment, social bonds creation, income development, better health, consumer choice, demographic impacts, and community development can be achieved by the proper usage of renewable energy systems.
6.	Scalability of the Solution	It can be applied on the large scale in the existing wind farm. So the performance can also be improved.

• : Problem Solution Fit

<p>1. CUSTOMER SEGMENT(S) Who is your customer?</p> <p>Wind energy producers.</p>	<p>6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions?</p> <p>Lack of Budget, They are not clear on how to utilize the wind turbine effectively to produce a steady electricity.</p>	<p>5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have?</p> <p>Estimation is calculated based in past year energy output.</p>
--	---	---

<p>2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers?</p> <p>To analyse the output energy of wind turbine in changing weather conditions. And to store the data in a dataset.</p>	<p>9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job?</p> <p>High initial cost setup and unpredictable changes in weather condition.</p>	<p>7. BEHAVIOUR What does your customer do to address the problem and get the job done?</p> <p>Calculates the usage and benefits. Collects the data from the potential wind farms and makes a comparison.</p>
--	---	--

<p>3. TRIGGERS If the customer finds it as an efficient solution. It will automatically trigger all other customers to do it.</p>	<p>10. YOUR SOLUTION The inlet condition of the wind turbine is forecasted by an auto regressive model. Hence it reduces the need for balancing energy and reserved power output energy.</p>	<p>8. CHANNELS of BEHAVIOUR It will analyse the data which are previously uploaded and predict the output energy.</p> <p>8.2 OFFLINE what kind of actions do customers take offline? The inlet condition of the wind turbine is maintained constantly.</p>

4 : REQUIREMENT ANALYSIS

• : Functional Requirements

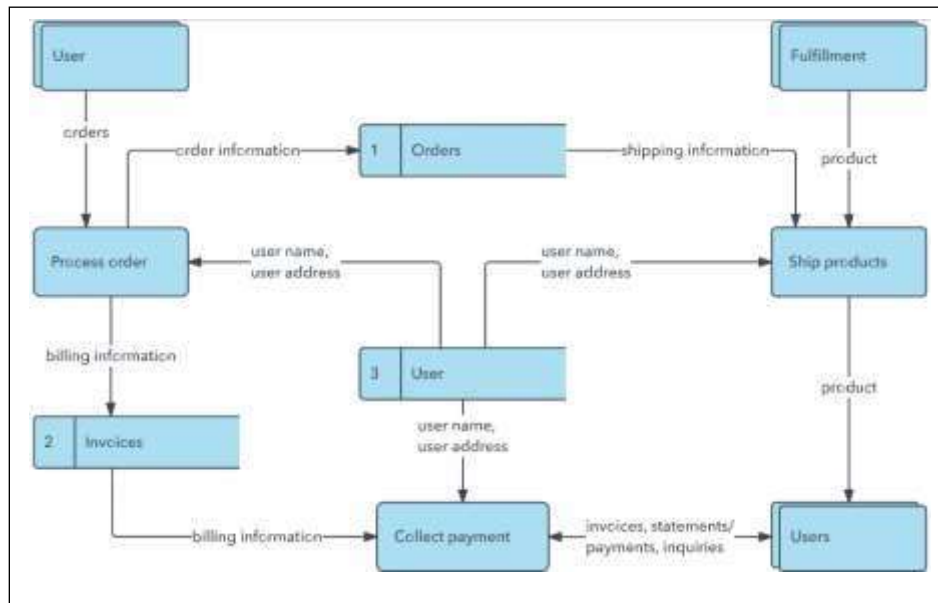

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail Registration through LinkedIn
FR-2	User Confirmation	Confirmation via meeting Confirmation via mail
FR-3	User Requirements	Knowledge about inputting the data Teaching on using the ML Model
FR-4	User Infrastructure	A system to support ML data modelling A Suitable GPU and CPU
FR-5	User Network	Network infrastructure to connect the wind mill to the Control station
FR-6	User Cost	User has to spend only for attaining the software, additional components are not required

• : Non – Functional Requirements

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	It can be used for various Wind mill and trained for specific models.
NFR-2	Security	The data can be stored in a secure cloud.
NFR-3	Reliability	The predicted will be accurate and can be relied upon.
NFR-4	Performance	The performance of the model depends on the Computer it runs on the accuracy of the data it is fed with.
NFR-5	Availability	It is available as a software package.
NFR-6	Scalability	It can be scaled up and interconnected with other Wind Mills to create a connected Wind Form.

5 : PROJECT DESIGN

• : Data Flow Diagrams

1. The Weather data and wind speed data is fed as input to the ML model.
2. The previous years data stored in a cloud is fed as input to the ML model.
3. The expected power production is predicted.
4. The predicted value is sent to the user, and also stored in cloud.
5. The predicted output power is compared with the actual power generated.
6. The error in prediction is calculated and used as a feedback to train the model.
7. The model accuracy increases over the course.

• : Solution and Technical Architecture

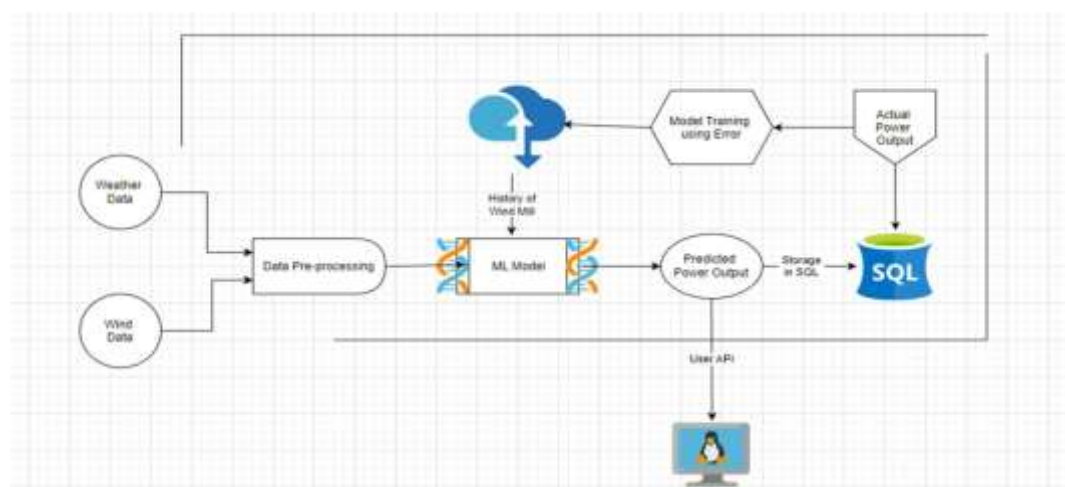

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	API	HTML, CSS, JavaScript / Angular Js / React Js etc.
2.	Application Logic-1	Data Pre-processing	Java / Python
3.	Application Logic-2	Data Input	IBM Watson STT service
4.	Database	Previous Year data	MySQL, NoSQL, etc.
5.	Cloud Database	Database Service on Cloud	IBM DB2, IBM Cloudant etc.
6.	File Storage	File storage requirements	IBM Block Storage or Other Storage Service or Local Filesystem
7.	External API	Purpose of External API used in the application	IBM Weather API, etc.
8.	Machine Learning Model	Purpose of Machine Learning Model	Weather prediction Model, etc.
9.	Infrastructure (Server / Cloud)	Application Deployment on Local System / Cloud Local Server Configuration: Cloud Server Configuration:	Local, Cloud Foundry, Kubernetes, etc.

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	List the open-source frameworks used	FLASK
2.	Security Implementations	List all the security / access controls implemented, use of firewalls etc.	SHA-256, Encryptions, IAM Controls, OWASP etc.
3.	Scalable Architecture	Justify the scalability of architecture (3 – tier, Micro-services)	Cloud
4.	Availability	Justify the availability of application (e.g. use of load balancers, distributed servers etc.)	Distributed cloud service
5.	Performance	Design consideration for the performance of the application (number of requests per sec, use of Cache, use of CDN's) etc.	SDN

• : User Stories

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user I can buy the ML model and train it customize according to the needs.	I can access my account / dashboard	High	Sprint-1
		USN-2	My Identity can be verified through a mail.	I can receive confirmation email & click confirm	High	Sprint-1
	Login	USN-1	As a user, I can log into the application by entering email & password.	I can login into the admin window	Low	Sprint-1
		USN-2	For different Wind Mill, various login can be used.	Different id and password can be used for different Wind Mills.	High	Sprint-2
	Dashboard	USN-3	The various functionalities can be viewed and navigated from the dashboard.	The options are clear and easily understandable.	Medium	Sprint-2

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer Care Executive	Queries	USN-1	The Customer Care executive answered my call and guided me.	He was calm and helped me through the process,	Medium	Sprint-2
	Initial Setup	USN-2	After the ML model has been bought the sales executive helped me setup the model.	He was clear and knowledgeable.	High	Sprint-3
Administrator	Remote Access	USN-1	I have remote access to all the models and can be worked on.	The remote access works flawlessly.	Medium	Sprint-4
		USN-2	The integration with cloud was easy and simple.	The cloud access is very good.	Low	Sprint-4

6 : PROJECT PLANNING AND SCHEDULING

• : Sprint Planning and Estimation

Sprint	Milestone
Sprint 1	<ol style="list-style-type: none">1. Users register into the application through entering Email Id, Password and Re-entering Password for confirmation.2. Users receive a confirmation mail to their registered Email.3. Users can also register to the application through a mobile number.4. User logs in into the website using Email Id and password or through Gmail
Sprint 2	<ol style="list-style-type: none">1. User can access the dashboard.2. User enters the required details of weather conditions to get the desired turbine power output based on our model's prediction.
Sprint 3	<ol style="list-style-type: none">1. Application stores the predictions, that can be used for future analysis.2. The data stored has to be maintained securely.
Sprint 4	<ol style="list-style-type: none">1. Administrator should properly maintain the website and update it whenever required.

• Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	05 nov 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	09 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	16 Nov 2022

This is the Excel sheet visualization of the dataset that has been taken for the ML Model. It contains 5 attributes. Date/Time, Active power generated, Theoretical power generated, Wind speed and Wind Direction. The data set has 50,000+ samples. It has data of a single wind mill's power production over a period of one year. The samples are taken at an interval of every 10 mins making 144 samples per day.

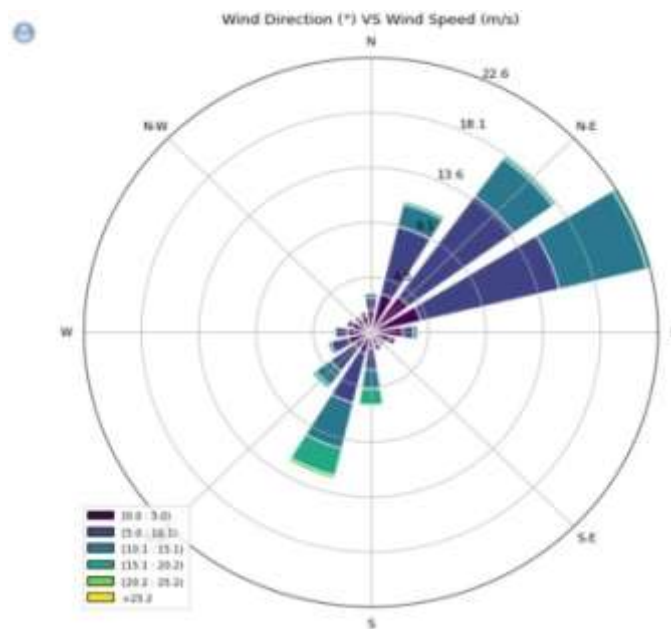

Dataset Description :

```
[ ] data.describe()
```

	ActivePower(kW)	WindSpeed(m/s)	TheoreticalPowerCurve(KWh)	WindDirection
count	50530.000000	50530.000000	50530.000000	50530.000000
mean	1307.684332	7.557952	1492.175463	123.687559
std	1312.459242	4.227166	1368.018238	93.443736
min	-2.471405	0.000000	0.000000	0.000000
25%	50.677890	4.201395	161.328167	49.315437
50%	825.838074	7.104594	1063.776283	73.712978
75%	2482.507568	10.300020	2964.972462	201.696720
max	3618.732910	25.206011	3600.000000	359.997589

This command displays the various parameters like count, mean, Standard deviation, minimum value, maximum value for the four attributes.

Wind Direction vs Wind Speed :

The plot gives a visualization of the direction of the Wind at the location over the year. It also shows the speed of the wind in that particular direction. From this we can infer that this particular Wind Mill experiences wind in a North-easterly direction primarily and south-westerly direction occasionally. The wind speed varies between 5 and 20 m/s.

Feature Inference :

The above graph plots the weightage of each attribute of the dataset. It helps to understand the dataset quickly and easily. The usual Windspeed in the region can be seen as 2 to 12 m/s. The prominent Wind direction is 30° to 75° and mildly along 190° to 210° measures from magnetic north. The actual power generated is also less compared to the theoretical power calculated with the wind speed. This is due to the mechanical and aerodynamic losses faced by the wind mill.

Output Power Visualization :

This is a graph plotted with time as x-axis and power generated in y-axis. 1000 samples (8 days) data has been taken for viewing the plot clearly. It shows the trend in power generation. On one day there is maximum output and next two days the power output is less owing to low wind speed.

Data Pre-processing:

```
data.shape
```

```
(50530, 5)
```

This command returns the dimension of our dataset. We have 50530 rows and 5 columns which are the features of the dataset.

```
data.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 50530 entries, 0 to 50529
Data columns (total 5 columns):
#   Column                                Non-Null Count  Dtype
---  -
0   Date/Time                             50530 non-null  object
1   ActivePower(kW)                       50530 non-null  float64
2   WindSpeed(m/s)                        50530 non-null  float64
3   TheoreticalPowerCurve(KWh)            50530 non-null  float64
4   WindDirection                         50530 non-null  float64
dtypes: float64(4), object(1)
memory usage: 1.9+ MB
```

This command returns whether our dataset has any null values and the datatype of the features. From the output we can see that there is no null-data type in the dataset and the values are of 64 bit floating point integer.

Splitting Data :

```
x=data[['WindSpeed(m/s)','WindDirection']]
x.head()

y = data['ActivePower(kW)']
y.head()

0    380.047791
1    453.769196
2    306.376587
3    419.645905
4    380.650696
Name: ActivePower(kW), dtype: float64

x.to_csv('IndependentVariables.csv')
y.to_csv('DependentVariable.csv')
```

The features are then split as dependent and independent variables for training the model. Wind speed and wind direction is taken as independent variables whereas Active power generated is taken as dependent variable.

Importing the Regression Models :

```
from sklearn.tree import DecisionTreeRegressor
from sklearn.svm import SVR
from sklearn.linear_model import LinearRegression
from sklearn.ensemble import RandomForestRegressor
from xgboost import XGBRegressor
from sklearn.metrics import accuracy_score,r2_score,mean_squared_error
xgr=XGBRegressor()
rf=RandomForestRegressor()
lr=LinearRegression()
dt=DecisionTreeRegressor()
sm=SVR()
```

The above command is used to import the required libraries to train the various models. Here we use five regression models for training namely Linear Regressor, XGBRegressor, Random Forest Regressor, Decision Tree Regressor and Support Vector Regression.

Fitting the Models with dataset :

```
model_xg=xgr.fit(X_train,y_train)
y_xg=model_xg.predict(X_test)
model_rf=rf.fit(X_train,y_train)
y_rf=model_rf.predict(X_test)
model_lr=lr.fit(X_train,y_train)
y_lr=model_lr.predict(X_test)
model_dt=dt.fit(X_train,y_train)
y_dt=model_dt.predict(X_test)
model_sm=sm.fit(X_train,y_train)
y_sm=model_sm.predict(X_test)
```

The above command is used to train the data. The five models are being fitted individually with the training data.

Checking the Metrics :

```
print('R2-xgb',r2_score(y_test,y_xg))
print('RMSE-xgb',np.sqrt(mean_squared_error(y_test,y_xg)))

print('R2-rf',r2_score(y_test,y_rf))
print('RMSE-rf',np.sqrt(mean_squared_error(y_test,y_rf)))

print('R2-lr',r2_score(y_test,y_lr))
print('RMSE-lr',np.sqrt(mean_squared_error(y_test,y_lr)))

print('R2-dt',r2_score(y_test,y_dt))
print('RMSE-dt',np.sqrt(mean_squared_error(y_test,y_dt)))

print('R2-sm',r2_score(y_test,y_sm))
print('RMSE-sm',np.sqrt(mean_squared_error(y_test,y_sm)))
```

[14]

```
... R2-xgb 0.9222746826171284

      RMSE-sm 1305.1786596858901
```

This command prints the score of all the five models that we have fitted. It displays the accuracy of each of the model. From the above statement we can see that XGBRegressor model has the highest accuracy of 92%.

XGBRegressor Model Training :

```
xg=XGBRegressor(colsample_bylevel=0.4, colsample_bytree=0.1, gamma=0.1,
                 learning_rate=0.01, max_depth=6, min_child_weight=25,
                 n_estimators=1500, reg_alpha=0.1, reg_lambda=0.8, subsample=0.6)
x=xgr.fit(X_train,y_train)
y1=x.predict(X_test)
r2_score(y_test,y1)
```

[07:14:27] WARNING: /workspace/src/objective/regression_obj.cu:152: reg:linear is now deprecated in favor of reg:squarederror.

0.9222746826171284

Since XGBRegressor model best fits the model, we select that and give our dataset to obtain the trained model.

Saving the Model :

```
model_xg.save_model('test_model.bin')
```

```
data=[[5.311336,259.994904]]
df = pd.DataFrame(data, columns=['WindSpeed(m/s)','WindDirection'])
xgr.predict(df)
```

This command saves our trained model as a .bin file. This file can then be called upon by our application to perform the prediction. This model accepts Wind speed and Wind Direction as input and gives the power generated as output.

• : Feature 2

Deploying the Model in IBM Cloud :

IBM Deployment

```
In [18]: !pip install -U ibm-watson-machine-learning

Requirement already satisfied: ibm-watson-machine-learning in /opt/conda/envs/Python-3.9/lib/python3.9/site-packages (1.0.255)
Collecting ibm-watson-machine-learning
  Downloading ibm_watson_machine_learning-1.0.257-py3-none-any.whl (1.8 MB)
    |#####| 1.8 MB 31.6 MB/s eta 0:00:01
```

Here the required library of IBM Watson Machine Learning is getting installed.

Authenticate and set Space

```
tt1xwHf_pNvesyStso2tawTipypHX0HEQ/VMev99cmAtK

In [28]: wml_credentials = {
        "apikey": "i78FO2zR1zKFzHnJarcCyrgk2xF1jaKtkVucF3AQ31h",
        "url": "https://eu-de.ml.cloud.ibm.com"

```

Deploying the model in IBM Cloud using model id. An id is created for the model using which the model can be accessed online.

Flask Application :

```
1  import flask
2  from flask import request, render_template
3  from flask_cors import CORS
4  import joblib
5  import pandas as pd
6  from xgboost import XGBRegressor
7  import requests
8  app = flask.Flask(__name__, static_url_path='')
9  CORS(app)
10
```

To import the required libraries

```

API_KEY = "iJBf02zR1zKFzPmJArCCyrgkg2xF1jaktkVucFJAQJ1h"
token_response = requests.post('https://iam.cloud.ibm.com/identity/token', data={"apikey":
API_KEY, "grant_type": 'urn:ibm:params:oauth:grant-type:apikey'})
mltoken = token_response.json()["access_token"]

header = {'Content-Type': 'application/json', 'Authorization': 'Bearer ' + mltoken}

```

The API key and model id are used to link to the model that has been trained in IBM Cloud.

```

@app.route('/', methods=['GET'])
def sendHomePage():
    return render_template('index.html')

@app.route('/predict', methods=['POST'])
def predictSpecies():
    ws = float(request.form['ws'])
    wd = float(request.form['wd'])

    X = [[ws,wd]]
    xgr=XGBRegressor()
    df = pd.DataFrame(X, columns=['WindSpeed(m/s)', 'WindDirection'])
    payload_scoring = {"input_data": [{"field": ['ws', 'wd'], "values":X}]}

    response_scoring = requests.post('https://eu-de.ml.cloud.ibm.com/ml/v4/deployments/782741b9-1e46-
headers={'Authorization': 'Bearer ' + mltoken})
    print(response_scoring)
    predictions = response_scoring.json()
    print(predictions)
    predict = predictions['predictions'][0]['values'][0][0]
    print("Final prediction :",predict)
    return render_template('predict.html',predict=predict)

if __name__ == '__main__':
    app.run()

```

This program serves as the backend for our Web page API and linking our Machine Learning model with it. The input that has been received from the home page is then sent to out ML model to do the prediction and the output will be displayed at the next web page. It is the connection between the Frontend and backend.

HTML Code :

```

Output Page :

8 : TESTING

• : Test Cases

Wind Speed (m/s)	Wind Direction (°)	Predicted Power Output (KW)
10.5	100.9	2695.02
6.6	290	751.88
30.7	220	3303.57
25.5	45	3595.69
19.1	0	1135.50
14.8	295	3758.29
8.3	180	1524.59
0.5	88	6.82
3.7	325	34.03
35.2	355	3819.80

• : User Acceptance Testing

The project has been tested extensively with a number of users. The users found the interface very easy to use. The Web pages were colourful and attractive. There was no unnecessary details in the web page. It was clean and simple that any new user could master it. The data input format was also simple. The user need not enter any unit. He could simply enter the value. The prediction time is fairly low at an average time of 3 seconds. This delay primarily varies depending on the internet connectivity. The model has been hosted in IBM cloud. Thus with the API available, the model can be accessed remotely from any system provided IBM access key is given. The model predicts the power output close to the actual power generated. The users are satisfied with the predicted output power. Although the prediction is not very accurate it comes closer to the actual power. Various inputs have been given by the users to test the consistency of the model. The model proved itself and all the users accepted the model as a reliable and convenient.

9 : RESULTS

• : Performance Metrics

The XGBRegressor ML model that we have used here has better performance in speed and accuracy compared to other models. We have compared the performance metrics of 5 models and selected this as the best for the application. The model performed well for all the test cases. The API developed also performed good with no glitches or lag found during the testing phase.

10 : Advantages and Disadvantages

• : Advantages

This model takes in the previous years energy outputs and correlate it with the weather and other parameters that affected it. By using this model we can give the Weather conditions as input and obtain the energy output. It also dynamically alters the algorithm based on the predicted value and actual output value. This model helps in increasing the usage of renewable energy. It optimizes the operation of Wind Turbines. The cost of Implementing this solution makes it an Unformidable one. Wind Energy Companies will be able to increase their energy output thereby increasing revenue. Wind Energy can be trusted as a consistent source as we are able to predict the total power output for any given time. This doesn't require any additional equipment to be set up at the Wind turbine. The existing Sensors can be used to get the Weather parameters for predicting the power output. With Weather stations all across the world, the data can be obtained easily in real time. The prediction can be carried out at the control station of the Wind mills. The algorithm can be easily modified to work for every single Wind Turbine.

• : Disadvantages

Wind Mill companies hesitate to completely rely on this model. Data availability is difficult for all the individual Wind Mills. The Wind Mill maybe in a remote location, providing connectivity to all of it proves challenging and expensive. Data Storage cost is very high, as the data for the output power and other attributes will be stored in the cloud. This is expensive for the company. The model needs Weather inputs for the prediction process. Error in this input values like Wind speed, Wind Direction, Temperature, Altitude, Humidity due to the inaccuracy in the instruments that is being can result in errors in prediction. Sudden changes in weather conditions prove difficult for the model to predict. The changing Climatic conditions across the globe every year, means that the previous year data is insignificant. Efficiency loss at the wind mill is difficult to calculate and it varies from one wind mill to the other. Human made changes like building infrastructures in the wind path can greatly affect the prediction which cannot be given as input. Server crash or loss of internet can leave the company with no other choice as the entire model is hosted in cloud.

11 : CONCLUSION

The XGBRegressor ML model that has been used above performs well for our dataset. The model is fast and consumes less resources. The API developed is also simple and user-friendly. By using this model, we could predict the output power of a wind turbine provided the required input parameter. This increases the use of Wind power and revenue for the companies. The model is not 100% accurate but it performs sufficiently. It can be concluded as the power output cannot be predicted very accurately as there are several parameters that could affect the output and all those outputs cannot be taken in for training as it can result in a very complex and overtrained model. The features that have high weightage are considered in this model.

12 : FUTURE SCOPE

The further works that can be done in this project is to include more features in model training to study the effect on the output. A long history of data (dataset of more than 3 years) can be used for training for increased accuracy. The application can be upgraded such that the input values from the sensors are directly fed to the model without the user entering it manually. More web pages can be designed so that the user can control more Wind Mill in the same API. Navigation tabs to move across various Wind mills. The dashboard can be made for User Interactive by making it to show real time graph of the prediction and actual power. Diagnosis of wind mill which perform the least can be done remotely.

```

<div class="header">Predicting The Energy Output Of Wind Turbine Based
On Weather Condition</div>

```

```

<div class="second">

```

```

<div class="inside">A wind turbine turns wind energy into electricity
using the aerodynamic force from the rotor blades, which work like an airplane wing or
helicopter rotor blade. <br><br>

```

```

The amount of electricity generated by wind increased by
almost 273 TWh in 2021 (up 17%), 45% higher growth than that achieved in 2020 and the
largest of all power generation technologies. Wind remains the leading non-hydro renewable
technology, generating 1 870 TWh in 2021, almost as much as all the others combined.

```

```

<br><br><br>

```

```
